GENERAL

This manual is intended to provide architects, engineers and builders with reference data on Gypsum Board Systems incorporating CertainTeed Canada gypsum board products. It contains sections on Partitions, Exterior Walls, Floors and Ceilings, Shaftwalls, Firewalls, Cement Board and Column and Beam Protection. Each section lists the systems in ascending order of fire rating, and includes sound ratings and basic construction details.

The Gypsum Board Systems Manual is available on our web site at www.certainteed.ca. Please visit the website regularly to check for the latest revisions and version of this manual. Further assistance regarding the application of CertainTeed Canada products in Gypsum Board Systems can be obtained by calling the CertainTeed Canada office nearest you.

Check with your authority having jurisdiction regarding Codes and consult the building designer for details and site installation instructions.

Any product information, data or specifications contained in this Manual have been prepared with information available to CertainTeed Canada at the time of posting. Anyone making use of, or relying on, any information, data or specifications contained in this Manual, for any purpose whatsoever, expressly assumes any and all liability that may arise from such use or reliance. CertainTeed Canada does not assume any responsibility for any errors or omissions that may be contained in this Manual. Any information, data or specifications contained in this Manual supersede any and all previous information, data or specifications prior to this manual and are subject to change without notice.

DEFINITIONS

**Fire Resistance Rating**: The degree to which construction assemblies resist the passage of heat and flame is indicated by ratings determined by full scale fire resistance tests conducted in accordance with CAN/ULC-S101 or ASTM E119.

**STC: Sound Transmission Class**, a single number which represents the overall performance of an assembly at all sound frequencies. As per ASTM E90 and E413, the higher the STC, the more efficient the system for reducing sound transmission.

**ASTC: Apparent Sound Transmission Class** includes the contributions from flanking transmission of sound and therefore is a better descriptor of the acoustic performance of the building.

TESTING AUTHORITIES

FIRE RESISTANCE

Gypsum board is the most commonly used fire resistant material and is equally well known as a reliable and economic surfacing material. When used in combination with other products, excellent fire resistant and sound control properties can be achieved.

Gypsum is a naturally occurring mineral mined or quarried in many locations throughout North America and in other parts of the world. When processed into gypsum board products the chemically combined water (about 21 percent by weight) contributes to its effectiveness as a fire barrier. As gypsum protected structural members are exposed to fire, the water is slowly released as steam, effectively retarding heat transmission and acting as a fire barrier until most of the chemically combined water is eliminated, a process known as calcination. The temperature directly behind the plane of calcination is only slightly higher than that of boiling water at 100˚C (212˚F), and that is considerably below the temperature at which steel begins to lose its strength or lumber ignites. Once the gypsum is completely calcined, the residue acts as an insulating barrier to the flames.

DSG, or desulphogypsum, is high purity gypsum that is produced instead of mined. Traditionally, the gypsum raw material in the core of drywall has been mined from natural deposits. There are numerous underground and surface mines producing this gypsum for drywall manufacturing plants across North America. DSG is fundamentally the same raw material as mined gypsum, with a higher degree of purity. As a result, its properties are virtually the same as mined gypsum.

Type X and Type C Gypsum Board

There are two basic classifications of gypsum board core formulations giving different degrees of fire resistance. These are Standard and Type X gypsum board. Type X board by definition is a gypsum board that provides: a 1 hour fire endurance rating for a 15.9 mm (5/8”) thickness when applied in a single layer and properly fastened to each side of 92 mm (3-5/8”) steel framing members.

OR

A 2 hour fire resistant rating for a 12.7 mm (1/2”) thick Type C board when applied in a double layer and properly fastened to each side of 64 mm (2-1/2”) steel framing members, when tested in accordance with CAN/ULC-S101.

Type X gypsum boards manufactured by CertainTeed Canada are described as either EGRG, GlasRoc®, Shaftliner, GlasRoc® Shaftliner, or Type X and these products are classified/listed by Underwriters Laboratories and Underwriters Laboratories of Canada.

CertainTeed Type C products and CertainTeed M2Tech® Type C products are proprietary products which meet the requirements of Type X and have further enhanced fire resistive properties. These products are often referred to as “Type C” gypsum board, although there is no industry definition for “Type C” gypsum board.

All CertainTeed Type X, CertainTeed Type C, M2Tech® Moisture and Mold Resistant Type X, M2Tech® Type C, CertainTeed Veneer Plaster Base Type X, Extreme Abuse M2Tech® Type X, M2Tech® Shaftliner Type X, GlasRoc® Sheathing Type X, GlasRoc® Shaftliner Type X, DiamondBack® GlasRoc® Tile Backer Type X, AirRenew® M2Tech® Type X, AirRenew® Essential Type X, Easi-Lite® 30, SilentFX® QuickCut™ Type X, Abuse Resistant Type C, Extreme Abuse M2Tech® Type X and Extreme Impact M2Tech® Type X products meet both the CSA and ASTM definitions of Type X gypsum board.

Fire Resistance Tests

There are a number of independent testing authorities capable of conducting fire tests to establish fire resistance classifications according to procedures outlined in:

The conditions for tests are thoroughly detailed and the time of failure is the time at which there is excessive heat transmission, passage of flame or structural failure. In addition, failure may result because of penetration by a pressurized hose stream required in the fire test procedure for wall assemblies.
The CAN/ULC-S101 standard, prescribes how various wall, floor, roof, column and beam assemblies are tested. These assemblies are one-sided exposed to a furnace that follows a standard cellulose time-temperature curve.

All of the assemblies tested and classified must be at least 9.3 m² (100 ft²) with no side dimension less than 2.75 m (9 feet). Temperatures are measured at a minimum of nine points on the unexposed surface of the assembly. When testing loadbearing assemblies, the working stress load is applied during the fire test.

The assembly must also stop flame or hot gasses capable of igniting cotton waste. The average temperature of the unexposed surface cannot increase more than 139˚C (250˚F) above ambient nor shall the temperature rise at any individual point exceed 181˚C (325˚F). It is also required that a duplicate of the assembly be fire tested for half the specified resistance period, after which it must withstand the impact, erosion and cooling effect of water under high pressure from a fire hose.

Floor and roof assemblies tested and classified have to be a minimum of 16.8 m² (180 ft²) with neither dimension less than 3.66 m (12 feet). The assemblies must sustain the design load throughout the test and not allow either flame or hot gasses, capable of igniting cotton waste, to pass through. The unexposed surface temperature may not rise more than an average of 139˚C (250˚F) above the initial temperature nor shall the temperature rise at any individual point exceed 181˚C (325˚F).

**Surface Burning Characteristics**

Flame spread ratings are intended as a guide in the selection and use of finishing materials and are obtained by measuring the extent and rapidity with which flames spread over their surfaces under test conditions.

Under certain circumstances some building codes may require the use of interior finish materials with a flame spread rating of not more than 25. The laboratory test generally used to establish a material’s flame spread characteristic is referred to as the Steiner Tunnel test.

**CAN/ULC-S102 “Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies.”**

This test measures relative flame spread, fuel contribution and the amount of smoke developed from the material being tested.

A method of numerical classification to permit comparison of a given material’s flame spread performance with that of another has been established.

SOUND CONTROL

Sound Transmission Class (STC)

Drywall construction systems are tested to establish their sound insulation characteristics and airborne sound insulation is reported as the Sound Transmission Class (STC).

ASTM Standard E90, “Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions”, outlines a procedure for measuring sound transmission loss which is the difference between the sound energy in a source room and a receiving room when the two rooms are separated by the assembly being tested. The sound transmission loss is measured at different test frequencies and this data is used to obtain a single number known as the STC rating calculated in accordance with ASTM E413.

Apparent Sound Transmission Class (ASTC).

ASTC includes the contributions from flanking transmission of sound and therefore is a better descriptor of the acoustic performance of the building. The ASTC rating between dwelling units must be 47 or greater for compliance with the 2015 NBCC.

Sound Insulation

STC values stated are based on laboratory tests. The actual STC ratings of assemblies as constructed may be significantly less due to deviations from the design or specified materials, flanking paths or poor workmanship. It is essential to the attenuation of airborne sound transmission that air leaks and flanking paths must be closed off or sound will go around an assembly. Hairline cracks or small holes will increase the sound transmission at the higher frequencies. This can have a detrimental effect on the overall acoustical performance and the STC particularly for higher rated assemblies.

Assemblies should be airtight. Recessed wall fixtures such as medicine cabinets, or electrical, telephone and television outlets, which perforate the gypsum board surface, should not be located back-to-back or in the same cavity. In addition, any opening for such fixtures and for piping outlets should be carefully cut to proper size and caulked. The entire perimeter of a sound insulating assembly must be made airtight to prevent sound flanking. An acoustical caulking compound or acoustical gasket should be used to seal between the assembly and all dissimilar surfaces. Taping gypsum board wall and wall-ceiling intersections provides an adequate air seal at these locations. Details of some typical problem areas and their recommended treatments are shown in the accompanying illustrations.

2015 National Building Code of Canada

APPARENT SOUND TRANSMISSION CLASS (ASTC)

In previous editions of the National Building Code of Canada (NBCC), sound insulation requirements between dwelling units were presented in terms of Sound Transmission Class (STC).

In the NBCC 2015, sound insulation requirements are now also presented in terms of Apparent Sound Transmission Class (ASTC). ASTC includes the contributions from flanking transmission of sound and therefore is a better descriptor of the acoustic performance of the building. The ASTC rating between dwelling units must be 47 or greater for compliance with the 2015 NBCC.

CertainTeed Canada contracted with the National Research Council Canada (NRC-CNRC) to conduct extensive testing and calculation programs for SilentFX® QuickCut™ Gypsum Board on wood and steel stud wall assemblies with example assemblies provided on the following page. For complete details of the ASTC programs, please refer to NRC-CNRC Reports A1-007750.3 (Wood Stud Walls) and A1-010179.1 (Steel Stud Walls) on the NRC-CNRC website or contact CertainTeed Marketing Technical Services at 1-800-446-5284.

CALCULATED STC RATINGS

Not all of the assemblies in this catalogue have been individually tested. Where no specific test data is available, a rating, calculated in accordance with the requirements of ASTM E413, is provided for guidance only. CertainTeed Canada makes no claim that these calculated ratings comply with, or are acceptable under, any building code.

An estimated STC rating, based on results of a similar assembly tested in accordance with recognized standards, will be clearly indicated. This is a judgement of how the particular assembly might react, however, actual performance may differ.

If specific compliance is required, tests should be conducted.
BUILDING CODES

Within Canada, Building Codes govern among other items, the type, use and application of construction materials. It is therefore important that the user, when determining the suitability of products and assemblies outlined in this manual, ensure that the requirements of the applicable Building Code(s) have been met.

MATERIAL AND APPLICATION STANDARDS

Gypsum board products and many of the accessories that are utilized in the construction and/or finishing of gypsum board are covered by standards. These standards set forth minimum requirements for their physical and/or performance characteristics, limits of use and methods of application.

The following major Standards Writing Authorities are cited in this manual.

ASTM American Society for Testing and Materials
CSA Canadian Standards Association
GA Gypsum Association

CertainTeed Canada Materials

CertainTeed Canada gypsum board products are manufactured to meet or exceed the following standards.

CertainTeed Canada Gypsum Board Product Standard(s)

| CertainTeed Regular + 54” | CAN/CSA-A82.27, ASTM C1396 |
| CertainTeed Type X + Type C | CAN/CSA-A82.27, ASTM C1396 |

Note: Any wall as listed in “Wood Stud Partitions” may also be used as an exterior wall, provided it is covered with a sheathing membrane and exterior cladding.
Lay out per construction drawings. Secure “J” track as perimeter framing on all sides, top and bottom, with suitable fasteners spaced 600 mm (24”) o.c. maximum.

Pre-plan stud layout 600 mm (24”) o.c. maximum so the terminal stud on either end will fall 200 mm (8”) minimum from the end of the opening.

Erect the first 25.4 mm (1”) M2Tech® or GlasRoc® Shaftliner panel by inserting between the flanges of the “J” track at the top and bottom at one end of the opening. Plumb the panel flush against the web of “J” track sections at the end of the opening.

Secure with 41 mm (1-5/8”) type S screws 305 mm (12”) o.c. to the flange at the end of the opening, starting 150 mm (6”) from the top or bottom. No screws are required at the top or bottom “J” tracks.

Fit a C-H, C-T or I stud to the Shaftliner making sure it’s engaged in the “J” track at the top and bottom.

Erect the adjacent Shaftliner panel by inserting in the top and bottom “J” track and the previously installed stud. Install succeeding studs and Shaftliner panels in this manner to complete the framing. Screws are not required for the top and bottom “J” tracks except at the ends of the opening, as described.

For doors, ducts or other openings install “J” track as perimeter framing.

When required for higher STC ratings, insulation should be friction fitted in the cavity before finishing on the cavity side with 15.9 mm (5/8”) CertainTeed Type X products. Resilient channels may be attached horizontally 600 mm (24”) o.c. to the studs with 10 mm (3/8”) pan head screws at each stud.

Helpful Hints

1. Use a fastening plate to secure the “J” track whenever fasteners are closer than 100 mm (4”) to the edge. Setting the plate at the time of concrete construction will avoid spalling by mechanical fasteners.
2. Pre-cut studs 12.7 mm (1/2”) less than the height of the opening.
3. Pre-cut M2Tech® or GlasRoc® Shaftliner panels 25.4 mm (1”) less than the height of the opening.
4. In structural steel frame construction, install “J” track sections before applying spray-on fireproofing.
5. Items to be anchored to the wall (cabinets, sinks, handrails, etc.) should be fastened to the C-H, C-T or I studs or to plates secured behind or between the layers of 15.9 mm (5/8”) CertainTeed Type X products.
6. Joint compounds should be applied at ambient temperatures above 10˚C (50˚F). Provide adequate ventilation to “drive-off” excess moisture.
7. For acoustic sealant and prevention of air leakage, use a bead of flexible caulking at the perimeter of each wall under the face layer of 15.9 mm (5/8”) CertainTeed Type X products and under the 54 mm (2-1/8”) flange of “J” track for shaftwall finished on one side.
8. Use type S screws for 0.46 mm (18 mils.) steel framing. Use type S-12 screws for 0.84 mm (33 mils.) or heavier steel framing.

Note: The sketches in this manual are intended for use by architects, engineers, contractors, consultants and designers for planning purposes only. These sketches may not be used for construction.
Recommended procedure for location of Gypsum Board Joints

M2Tech® or GlasRoc® Shaftliner panels may be abutted (spliced) to span the floor-ceiling height. The shorter panel should be at least 600 mm (24") long or of sufficient length to engage at least two "I" stud tabs on each panel edge, if I studs are used. Succeeding butt joints between adjoining panels should be spaced no closer than 600 mm (24") in elevation.

As an option, and as required in some building code jurisdictions, butt joints in Shaftliner panels may be back blocked in the cavity by screw-attaching a 300 mm x 600 mm (12" x 24") piece of M2Tech® or GlasRoc® Shaftliner or 15.9 mm (5/8") CertainTeed Type X products over the joint to the tabs of the studs.

First Layer
The first layer of 15.9 mm (5/8") CertainTeed Type X products should be installed with horizontal joints offset a minimum of 300 mm (12") from any butt joint in the M2Tech® or GlasRoc® Shaftliner. Any vertical butt joints in the first layer should be staggered in 1200 mm (48") increments between succeeding courses. In addition, joints must be offset from joints on opposite side.

Second Layer
The second layer of 15.9 mm (5/8") CertainTeed Type X products should be installed with vertical joints offset 600 mm (24") from any vertical butt joints in the first layer. Any horizontal butt joints in the second layer should be offset a minimum of 300 mm (12") from any horizontal joints in the first layer and from any butt joints in the M2Tech® or GlasRoc® Shaftliner. Succeeding butt joints in the second layer between adjoining panels should be spaced no closer that 600 mm (24") in elevation.

Third Layer, if needed for a 3-Hour Vertical Shaftwall System
The third layer of 15.9 mm (5/8") CertainTeed Type C products should be installed with vertical joints offset 600 mm (24") from any vertical joints in the second layer. Any horizontal butt joints in the third layer should be offset a minimum of 150 mm (6") from any horizontal joint in the previous layer, including M2Tech® Shaftliner. Succeeding butt joints in the third layer between adjoining panels should be spaced no closer than 300 mm (12") in elevation.

M2Tech® or GlasRoc® Shaftliner gypsum boards are used in conjunction with other CertainTeed gypsum board products in Firewalls. Firewalls are solid type separation walls assembled using 25.4 mm (1”) M2Tech® or GlasRoc® Shaftliner gypsum boards, metal framing and any minimum 12.7 mm (1/2”) CertainTeed gypsum boards approved for wall construction for the interior finish. The firewall is easily stacked, floor to floor, allowing progressive construction.

Breakaway aluminum clips are used to attach the interior wall to adjacent structural metal framing and provide lateral support. When one side is exposed to fire, the clips will soften and release if the burning unit collapses. The clips on the non-fire side are protected by the firewall and will continue to support the firewall. The Firewall will remain intact to protect neighboring spaces. Firewalls are easier and faster to construct, lighter weight, and take up less space than masonry wall systems.

Installation*

Steel framing and installation of 25.4 mm (1”) M2Tech® or GlasRoc® Shaftliner gypsum boards for solid type Firewalls are used as the common wall of one unit. A Firewall can be constructed by following these steps before continuing to frame the adjacent unit.

1. Attach 51 mm (2”) wide C-Track to slab at bottom of wall using suitable fasteners at a maximum of 610 mm (24”) o.c. Allow a minimum 19 mm (3/4”) space from wood stud framing on each side of the firewall. As an alternate to the 19 mm (3/4”) air space the steel components are permitted to be covered with either (a) 152 mm (6”) wide batten strips of 12.7 mm (1/2”) gypsum panel screw attached to the framing with 25.4 mm (1”) Type S drywall screws or (b) 25.4 mm (1”) mineral wool fiber insulation. Space ends of adjacent sections of C-Track a minimum of 6 mm (1/4”) apart. When required, use an approved acoustical sealant to caulk around the perimeter of wall sections.

2. Install vertical C-Track at the beginning of the wall and support as needed.

3. Insert two sections of 25.4 mm (1”) M2Tech® or GlasRoc® Shaftliner gypsum boards in the bottom channel and plumb to vertical C-Track. Make sure the first two shaftliner panels are seated all the way into the floor and vertical C-Tracks and that the edges are flush. Insert an H-Stud into the floor C-Track and engage the H-Stud legs over the long edges of the shaftliner panels.

4. Install the next 25.4 mm (1”) M2Tech® or GlasRoc® Shaftliner gypsum boards vertically into the H-Studs. Continue wall as needed by placing H-Studs between the proceeding panels every 610 mm (24”) for the length of the wall and enclose the end boards with vertical C-Track.

5. Cap the wall assembly before continuing higher using C-Track fastened to the H-Studs on alternate sides with 10 mm (3/8”) Type S screws. A second C-Track for the next row of shaftliner panels is then placed back to back with end joints staggered at least 300 mm (12”) o.c. and fastened with double 10 mm (3/8”) Type S screws at ends and 600 mm (24”) o.c.

6. Attachment Clips: Aluminum angle; 16 mm (0.063”) thick, minimum 51 mm (2”) and 57 mm (2-1/4”) legs. Clips are secured with Type S screws 10 mm (3/8”) long to H-Studs and with Type W screws 32 mm (1-1/4”) long to wood framing through holes provided in the clip. Clips should be attached to each H-Stud per the following schedule:

• For firewalls up to 7 m (23’) high, clip placement should be:
  i. Clips are required to be spaced a maximum of 3 m (10’) o.c. vertically between wood framing and H-Studs.

• For firewalls greater than 7 m (23’) high and up to 13.4 m (44’) high, clip placement should be:
  i. The lower 6.1 m (20’) requires clips to be spaced a maximum of 1.5 m (5’) o.c. vertically between the wood framing and the H-Studs
  ii. The upper section of the wall (6.1 m to 13.4 m) (20’ to 44”) requires the clips to be spaced a maximum of 3 m (10”) o.c. vertically between the wood framing and the H-Studs.

• For firewalls greater than 13.4 m (44”) high and up to 20.7 m (68’) high, clip placement should be:
  i. The lower 7.3 m (24’) requires clips to be spaced a maximum of 1 m (40”) o.c. vertically between the wood framing and the H-Studs.
  ii. The next 6.1 m (20”) section requires clips to be spaced a maximum of 1.5 m (5”) o.c. vertically between the wood framing and the H-Studs.
    iii. The upper section of the wall 13.4 m to 20.7 m (44” to 68”) requires the clips to be spaced a maximum of 3 m (10”) o.c. vertically between the wood framing and the H-Studs.
7. Cap the top of the assembly with 51 mm (2") C-Track and protect the entire installation from moisture. The firewall must extend above the roof deck.

* It is important for structural purposes that the above installation particulars be followed to provide lateral support for the firewall.

**Interior Finish Wall**

8. Wood Studs – Nominal 38 mm x 89 mm (2" x 4") with a maximum spacing of 610 mm (24") o.c. Studs are cross-braced at mid-height where necessary for clip attachment. Ensure a minimum 19 mm (3/4") separation between wood framing and Firewall.

9. Insulation (Optional) – CertainTeed's Sustainable Insulation™ (Optional) – CertainTeed CertaSound™ NoiseReducer™, Sustainable Insulation™, or equivalent, installed between wood studs to meet listed STC performance.

10. CertainTeed gypsum boards, minimum 12.7 mm (1/2") thick, 1220 mm (48") wide, applied either horizontally or vertically. Gypsum boards are attached to studs with 32 mm (1-1/4") long steel drywall nails or 32 mm (1-1/4") Type W drywall screws spaced 200 mm (8") o.c. Vertical joints are located over studs. Joints and fasteners are finished with CertainTeed Finishing system.

</tr>
</tbody>
</table>

12.7 mm (1/2") CertainTeed Type C product, 1 layer. 41 mm (1-5/8") steel studs positioned at column corners, 12.7 mm (1/2") less than column height. Install board vertically with 25 mm (1") screws spaced 610 mm (24") o.c. Apply corner bead with 25 mm (1") screws spaced 305 mm (12") o.c. Tape and finish joints with CertainTeed products.

**COLUMN**

Minimum W250 x 73 (W10 x 49)

Weight:

1. System WC1Ab
   - 12.7 mm (1/2") CertainTeed Type C product, 2 layers. 41 mm (1-5/8") steel studs positioned at column corners of HSS – 102 x 102 x 5 (4" x 4" x 0.188") column, 12.7 mm (1/2") less than column height. Install board vertically with 25 mm (1") screws spaced 610 mm (24") o.c. and fasten first layer using 25 mm (1") screws spaced 610 mm (24") o.c. Second layer fastened using 44 mm (1-3/4") screws spaced 305 mm (12") o.c. For an HSS – 200 x 200 x 6 (8" x 8" x 0.250") column, replace two layers of 12.7 mm (1/2") CertainTeed Type C with 1 layer of 15.9 mm (5/8") CertainTeed Type X. Fasten using 25 mm (1") screws spaced 610 mm (24") o.c. Apply corner bead with 25 mm (1") screws spaced 305 mm (12") o.c. Tape and finish joints with CertainTeed products.

2. System WB2A
   - 15.9 mm (5/8") CertainTeed Type X products, 2 layers. 43 mm x 25.4 mm (1-11/16" x 1") steel channels and 25.4 mm x 50 mm (1" x 2") steel angles. Leave a minimum 12.7 mm (1/2") clearance at sides and bottom of beam. Attach angle to steel deck with 12 mm (1/2") Phillips pan head screws spaced 300 mm (12") o.c. Attach channel brackets to angle 600 mm (24") o.c. with 12 mm (1/2") Phillips pan head screws. Attach steel angle to lower corners of U-brackets with 12 mm (1/2") Phillips pan head screws at 400 mm (16") o.c. Install base layer of board with 30 mm (1-3/4") screws spaced 200 mm (8") o.c. Joints must be offset. Attach corner bead, tape and finish joints with CertainTeed products.

**BEAM**

Minimum W200 x 36 (W8 x 24) steel beam. Weight: 29 kg/m² (6 lb/ft²)

Weight:

3. System WB2B
   - 15.9 mm (5/8") CertainTeed Type X products, 2 layers. 43 mm x 25.4 mm (1-11/16" x 1") steel channels. Leave a minimum 12.7 mm (1/2") clearance at sides and bottom of beam. Attach angle to steel deck with 12 mm (1/2") Phillips pan head screws spaced 300 mm (12") o.c. Attach channel brackets to angle 600 mm (24") o.c. with 12 mm (1/2") Phillips pan head screws. Insert corner angle in channel bracket cutout, screw attachment is not required. Install base layer of board with 30 mm (1-1/4") screws spaced 400 mm (16") o.c. Install face layer with 45 mm (1-3/4") screws spaced 200 mm (8") o.c. Joints must be offset. Attach corner bead, tape and finish joints with CertainTeed products.

**STEEL STUD PERMABASE PARTITIONS**

**STEEL STUD PERMABASE PARTITIONS (CHASE WALL)*** Non-Loadbearing

**FIRE RESISTANCE RATING:** 2h (continued)

**System PPC261**

- Fasten 12.7 mm (1/2") CertainTeed Type C products vertically or horizontally to each side of 92 mm (3-5/8") steel studs using 25 mm (1") screws spaced 305 mm (12") o.c. Fasten a face layer of 12.7 mm (1/2") PermaBase horizontally to each side using 41 mm (1-5/8") screws spaced 230 mm (9") o.c. Install 89 mm (3-1/2") minimum 34 kg/m³ (2.1 lb/ft³) mineral wool insulation in the cavity. All joints must be staggered a minimum of 300 mm (12"). Tape and finish PermaBase joints with fiberglass mesh joint tape and latex-modified Portland cement mortar applied at a minimum rate of 2.7 kg/m² (0.55 lb/ft²).

**FIRE:** ULC W439

**SOUND:** NRC CR-6466.5

**System PPA153**

- Position paired 41 mm (1-5/8") steel studs and track a minimum of 9.5 mm (3/8") apart. Maintain separation between paired steel studs by attaching steel stud bridging 760 mm (30") o.c. to steel stud webs using self-drilling, self-tapping screws (two per stud).

- Fasten 12.7 mm (1/2") PermaBase horizontally to one side using 25 mm (1") screws spaced 150 mm (6") o.c. on the perimeter and 200 mm (8") o.c. in the field. Install 89 mm (3-1/2") minimum 45 kg/m³ (2.8 lb/ft³) mineral wool insulation in the cavity. Fasten 15.9 mm (5/8") CertainTeed Type X products vertically to the other side with 25 mm (1") screws spaced 300 mm (12") o.c. All joints must be staggered a minimum of 300 mm (12"). Tape and finish PermaBase joints with fiberglass mesh joint tape and latex-modified Portland cement mortar applied at a minimum rate of 2.7 kg/m² (0.55 lb/ft²). Tape and finish CertainTeed Type X products with CertainTeed products. 15.9 mm (5/8") CertainTeed Type X products may be substituted for the 12.7 mm (1/2") CertainTeed Type C products in this assembly.

**FIRE:** ULC W438

**SOUND:** Estimate based on NRC CR-6466.1

**System PPA157**

- Position paired 41 mm (1-5/8") steel studs and track a minimum of 9.5 mm (3/8") apart. Maintain separation between paired steel studs by attaching steel stud bridging 760 mm (30") o.c. to steel stud webs using self-drilling, self-tapping screws (two per stud).

- Fasten 12.7 mm (1/2") CertainTeed Type C products vertically or horizontally to one side using 25 mm (1") screws spaced 800 mm (32") o.c. on the perimeter and 300 mm (12") o.c. in the field. Fasten a face layer of 12.7 mm (1/2") PermaBase horizontally to the same side using 41 mm (1-5/8") screws spaced 150 mm (6") o.c. on the perimeter and 200 mm (8") o.c. in the field. Install 89 mm (3-1/2") minimum 45 kg/m³ (2.8 lb/ft³) mineral wool insulation in the cavity. Fasten 12.7 mm (1/2") CertainTeed Type C board vertically to the other side with 25 mm (1") screws spaced 300 mm (12") o.c. in the field. All joints must be staggered a minimum of 300 mm (12"). Tape and finish PermaBase joints with fiberglass mesh joint tape and latex-modified Portland cement mortar applied at a minimum rate of 2.7 kg/m² (0.55 lb/ft²). Tape and finish outer layer CertainTeed Type C products' joints with CertainTeed products. 15.9 mm (5/8") CertainTeed Type X products may be substituted for the 12.7 mm (1/2") CertainTeed Type C products in this assembly.
