GlasRoc® Shaftliner is a paperless mold and moisture resistant gypsum board combining reinforcing glass mats and a specially formulated fire and moisture resistive, non combustible core.

GlasRoc® Shaftliner offers:

- Long term protection (12 months) to weather exposure.
- A superior water resistant surface that does not inhibit water vapor permeance.
- Excellent fire resistance properties, and numerous fire rated designs.
- Achieves scores of 10 and 0 for mold resistance per ASTM D 3273 and ASTM G 21, respectively; the best possible scores for these tests.

GlasRoc® Shaftwall Systems

1 & 2 Hour Fire Resistance Ratings

The walls of elevator shafts and stairwells are a vital life safety link in multi-story buildings. These walls are the main line of defense against fire entering the cavities behind them and spreading rapidly from floor to floor. Gypsum shaftwall systems have replaced traditional masonry for interior vertical enclosures including mechanical enclosures, stairwells, elevator enclosures, and other mechanical chases. Some inherent advantages of paperless gypsum shaftwall systems are: lightweight construction, thinner walls, ease and speed of installation and clean up, cost-effective construction.

Shaftwall Systems provide one or two hour fire resistance ratings in non-loadbearing configurations.
and moisture and mold resistance during construction. The systems are designed to withstand the intermittent surges of air pressure caused by fast moving elevator cabs. These systems utilize either an I-Stud, C-H Stud or a C-T Stud and J-Track to support layers of 1" (25.4 mm) GlasRoc® Shaftliner Type X and either 1/2" (12.7 mm) ProRoc® Moisture and Mold Resistant Type C with M2Tech® or 5/8" (15.9 mm) ProRoc® Moisture and Mold Resistant Type X with M2Tech® gypsum boards.

EITHER I-STUD, C-H STUD OR C-T STUDS MAY BE USED IN CONJUNCTION WITH GlasRoc® shaftwall systems. All of the components are noncombustible.

**Shaftwalls can be erected from one side, eliminating the need to build extensive scaffolding.**

From a cost standpoint, GlasRoc® Shaftwall assemblies save money in several ways. With less weight per square area than other shaft enclosures, structural framing requirements are reduced; as is the need for heavily reinforced footings. The 2' (610 mm) wide GlasRoc® Shaftliner slides quickly into the I-Stud, C-H Stud or C-T Stud and automatically provides 24" (610 mm) o.c. spacing. Shaftwalls can be erected from one side, eliminating the need to build extensive scaffolding. No finishing is required on the shaft side of the partition.

1. All construction shall comply with local building codes.
2. Only those components specified shall be used when constructing any fire or sound rated system. Substitutions may adversely affect performance capabilities.
3. Unless otherwise specified in the system design, face layer joints of 1/2" (12.7 mm) ProRoc® Type C, 5/8" (15.9 mm) ProRoc® Type X or 5/8" (15.9 mm) ProRoc® Type C gypsum boards shall be taped and finished with joint compound as described in “Surface Preparation” section.

**Fire Resistance Rated Designs**

Working with the Product

Cutting
The score and snap method is a fast and efficient way to cut GlasRoc® gypsum board.

Steps:
1. On the logo side, position a straight edge along the line of cut.
2. Score sheets with a knife or other suitable tool.
3. With a quick, firm motion, snap back away from the face.
4. The back can either be cut with a knife or separated by snapping the piece in the opposite direction.
5. Smooth all cut ends and edges to ensure tight joints.

To make cutouts, score around the perimeter on the face and back and tap out the waste piece from the face side. Cutouts can also be made with a drywall saw.

GlasRoc® gypsum boards can also be cut with a saw. For information on avoiding dust inhalation, refer to the Safety Data Sheet available on our website, www.certainteed.com. Safety glasses should always be worn when using power tools.

Installation
Steel Framing and Installation of GlasRoc® Shaftliner gypsum boards.

1. Lay out per construction drawings.
2. Install J-Track along the floor and ceiling and vertically at columns or abutting partitions, positioning the long legs closest to the shaft. Secure each piece with the appropriate power driven fasteners spaced a maximum 24" (600 mm).
3. Pre plan stud layout 24" (610 mm) o.c. maximum so the terminal stud on either end will fall a minimum of 8" (200 mm) from the opening.
4. Install GlasRoc® Shaftliner gypsum boards vertically. Cut boards a maximum of 1" (25 mm) less than floor to ceiling height. The leading edge of the first board must be attached to the long leg of the vertical J-Track with 1-5/8" (41 mm) Type S screws spaced 24" (600 mm) o.c. or by tabs in the J-Track. Secure the top and bottom edges using the same fasteners and spacing or using the tabs.
5. Friction fit an I, C-H or C-T Stud into the top and bottoms tracks and slide it snugly against the GlasRoc® Shaftliner gypsum boards. Make sure the edge of the board is in full contact with the center web of the stud and covered by all of the tabs.
6. Erect adjacent GlasRoc® Shaftliner gypsum boards by inserting in the top and bottom J-Track and between the tabs and flange on the opposite side of the I, C-H or C-T Studs to complete framing. Check periodically to ensure they are plumb. Screws are not required for the top and bottom J-Tracks.
7. For doors, ducts or other openings install J-Track as perimeter framing.
8. For walls exceeding 12' (3660 mm) in height, GlasRoc® Shaftliner gypsum boards may be butt to span the floor-ceiling height. The shorter panel should be at least 24" (600 mm) long or of sufficient length to engage at least two I, C-H or C-T Stud tabs on each panel edge. End joints should fall alternately in the upper and lower 1/3 of the partition. Subsequent butt joints between adjoining panels should be spaced no closer than 24" (600 mm) in elevation. Joints may be butted together or use a I, C-H or C-T Stud placed horizontally between boards to secure each joint.
9. As an option, and as required in some building code jurisdictions, butt joints in GlasRoc® Shaftliner gypsum boards may be back blocked in the cavity by screw attaching a 12" x 24" (300 mm x 600 mm) piece of 5/8" (15.9 mm) ProRoc® Type X with M2Tech® or 1" (25.4 mm) GlasRoc®
Shaftliner gypsum board over the joint to the tabs of the I, C-H or C-T Studs
10. Frame all cut openings in the shaft side with J-Track, providing adequate structural support for the openings over 48" (1220 mm).
11. Elevator door frames must be tied to shaftwall enclosures; however, they must remain independently supported by the building frame. Attach GlasRoc Shaftwall System to elevator door frame jamb and anchor clips with pan head screws. The J-Track 3" (76 mm) leg is used at the intersection of the elevator door frame and shaftwall system.
12. Where required, use an acoustical sealant to caulk around the perimeter of wall sections, door frames, call boxes and any other openings that may allow air passage.

1-Hour-Rated System: Finished One Side
1. Install a base layer of 1/2" (12.7 mm) ProRoc® Type C with M2Tech® or 5/8" (15.9 mm) ProRoc® Type X with M2Tech® gypsum board. Attach the base layer to the channels using 1" (25 mm) Type S buglehead drywall screws spaced 24" (600 mm) o.c. along the edges and in the field of the board with the first screw 3" (75 mm) from board end. Attach the face layer to the channels using 1-5/8" (41 mm) No. 6 Type S buglehead screws spaced 12" (300 mm) o.c. along the edges and in the field with the first screw 6" (150 mm) from board end.
5. Apply caulking under the top and bottom tracks and around the exterior face perimeters of each layer of 1/2" (12.7 mm) ProRoc® Type C with M2Tech® or 5/8" (15.9 mm) ProRoc® Type X with M2Tech® gypsum board.

2-Hour-Rated System: Finished Two Sides
1. Install resilient furring channels, 1/2" (12.7 mm) gauge/0.0188" (0.478 mm) thick, on the face side horizontally to I, C-H or C-T Studs at 24" (610 mm) o.c.
2. Secure channels to each stud with 3/8" (10 mm) Type S panhead screws.
4. Apply a double layer of 1/2" (12.7 mm) ProRoc® Type C with M2Tech® or 5/8" (15.9 mm) ProRoc® Type X with M2Tech® gypsum board. Attach the base layer to the channels using 1" (25 mm) Type S buglehead drywall screws spaced 24" (600 mm) o.c. along the edges and in the field of the board with the first screw 3" (75 mm) from board end. Attach the face layer to the channels using 1-5/8" (41 mm) No. 6 Type S buglehead screws spaced 12" (300 mm) o.c. along the edges and in the field with the first screw 6" (150 mm) from board end.
5. Spot cover all fastener heads with three coats of joint compound applied in different directions.

Limitations
• GlasRoc Shaftwall Systems are for non-loadbearing partitions only.
• GlasRoc Shaftwall Systems shall not be exposed to sustained temperatures exceeding 125°F (52°C).
• GlasRoc gypsum board should not come in direct contact with concrete, masonry or other surfaces that have a high moisture content.
• GlasRoc Shaftwall Systems are not designed to serve as an unlined air supply duct. Where gypsum board is used in air handling systems, the board temperature shall be maintained above the air stream dew point temperature but not higher than 125°F (52°C).
• Caulk to seal perimeters and penetrations to minimize air noises and dust associated with air movement.
Working with the Product

**Helpful Hints**

1. Use a fastening plate to secure the J-Track whenever fasteners are closer than 4' (100 mm) to the edge. Setting the plate at the time of concrete construction will avoid spalling by mechanical fasteners.
2. Pre-cut I, C-H or C-T Studs 5/8' (16 mm) less than the height of the opening.
3. Pre-cut 1' (25.4 mm) GlasRoc® Shaftliner boards 1' (25 mm) less than the height of the opening.
4. In structural steel frame construction, install J-Track sections before applying spray-on fireproofing.
5. Items to be anchored to the wall (cabinets, sinks, handrails, etc.) should be fastened to the I, C-H or C-T Studs or to plates secured behind or between the layers of ProRoc® Type X or Type C with M2Tech®.
6. Joint compounds should be applied at ambient temperatures above 50ºF (10ºC). Provide adequate ventilation to "drive-off" excess moisture.
7. For acoustic sealant and prevention of air leakage, use a bead of flexible caulking at the perimeter of each wall under the face layer and under the 2-1/2' (64 mm) flange of J-Track for shaftwall finished on one side to minimize whistling and dirt accumulation.
8. Use Type S screws for 25 ga steel framing. Use Type S-12 screws for 20 ga or heavier steel framing.

**Handling and Storage**

GlasRoc® gypsum boards should be stacked flat on a smooth, level surface, not directly on the ground. When spacers are used, position them closely enough together to minimize warpage. Care should be taken to prevent damage to edges and corners. Always keep GlasRoc® and ProRoc® gypsum board dry prior to installation. CertainTeed assumes no responsibility for consequential damages that may result from the presence of standing water.
1"[25.4mm] GlasRoc® Shaftliner gypsum boards are inserted between 2-1/2'[64mm], 4'[102mm] or 6'[152mm] I, C-H, or C-T Studs. A single layer of 5/8'[15.9mm] ProRoc® Type X with M2Tech® gypsum board is applied vertically, parallel to framing, on open stud-face side with 1"[25 mm] Type S screws spaced 12"[300 mm] on center. Exposed joints and screwheads are to be finished with ProRoc® Finishing System unless otherwise specified. (Non-Loadbearing)

Gypsum Board Shaftwall Assemblies

PART 1—GENERAL

1.1 PROJECT DESCRIBED

When installing one or two hour fire resistance rated shaftwall systems, staircases, elevator enclosures, or other mechanical enclosures.

1.2 QUALIFICATIONS

All gypsum materials used in the described system installations shall be manufactured by CertainTeed and carry the GlasRoc® and ProRoc® brand identity. CertainTeed or its representative will provide verification that the products specified in the described performance specification meet the applicable ASTM standards for performance described herein. Additional framing materials including J-Track, I-Stud, C-H Stud or C-T Stud and fasteners must be supplied and manufactured in accordance with stated construction guidelines.

1.4 DELIVERY, STORAGE, HANDLING

GlasRoc® gypsum boards are delivered in original, unopened containers or wrapped and stacked flat on a smooth, level surface, but not stored directly on concrete floors. When spacers are used, they are positioned closely enough together to minimize warpage. Care is taken to prevent damage to edges and corners. Always keep GlasRoc® and ProRoc® gypsum boards dry prior to installation. Do not use shipping bags for outdoor storage of material.

1.5 INSTALLATION ENVIRONMENT

GlasRoc® gypsum board must not be used in areas that are continually or repetitively exposed to excessive moisture or temperatures above 125°F (52°C). No treatment of joints shall be done until the interior temperature has been maintained at a minimum of 50°F (10°C) for at least 48 hours prior to application of joint treatment materials. Adequate continuous ventilation must also be provided during the finishing of joints. Joints, corners and fastener heads shall be finished in accordance with ASTM C 840. Fire Protection Association Fire Resistance Design Manual GA-600, CAN/CSA-A82.31 and ProRoc® Joint Compound manufacturer’s instructions. Joint Compound shall comply with ASTM C 475. No finishing is required on the shaft side of partitions.

UL U417, ULC W446

For further technical information regarding sound control and fire resistance refer to the following reports: Gypsum Association Fire Resistance Design Manual - GA-600 (WP 7051, WP 7084, WP 7254, WP 7255).

Studs complying with the requirements for ASTM A 653 SS Grade 33.

A-1. Stud Form

Studs can be in the form of I, C-H or C-T Studs with J-Tracks.

A-2. Stud Width

Galvanized I or C-H or C-T Studs are available in widths of 2-1/2, 4, and 6” (64 mm, 102 mm, 152 mm).

A-3. Stud Thickness

Studs manufactured from steel having minimum design steel thickness of 0.0188” (0.478 mm) and 0.0329” (0.836 mm).

A-4. Stud Coating

Studs have a G40 or G60 galvanized coating.

B. Fasteners

1-5/8” (41 mm) long No. 6 Type S screws, 1” (25 mm) long No. 6 Type S buglehead screws, 3/8” (10 mm) long Type S panhead screws.

C. GlasRoc® Gypsum Board

C-1. GlasRoc® Shaftliner Type X 1” (25.4 mm) thick

C-2. ProRoc® Moisture and Mold Resistant Type C with M2Tech® gypsum board with 1” (15.9 mm) thick

C-3. ProRoc® Moisture and Mold Resistant Type X with M2Tech®- 5/8” (15.9 mm) thick

C-4. ProRoc® Moisture and Mold Resistant Type C- 5/8” (15.9 mm) thick

D. ProRoc® Joint Finishing

D-1. ProRoc® Brand Joint Compound

D-2. ProRoc® Mold Resistant Joint Compound

D-3. ProRoc® Brand Joint Tape

D-4. ProRoc® Moisture and Mold Resistant Setting Compound with M2Tech®

D-5. FibraTape® Mold Resistant Drywall Tape

E. Acoustical Sealant

F. CertainTeed fiberglass, or equivalent, or mineral fiber insulation.

G. Resilient Channels

PART 3—INSTALLATION

3.1 CONSTRUCTION BRIEFS

General

Construction consists of steel studs and tracks fastened on one side with GlasRoc® Shaftliner and on the opposite side with, one or two (depending on the application specifications) layers of either 1/2” (12.7 mm) ProRoc® Type C with M2Tech®, 5/8” (15.9 mm) ProRoc® Type X with M2Tech® or 5/8” (15.9 mm) ProRoc® Type C with M2Tech® gypsum board. The following steps pertain to one or two hour fire rated installation with one finished side:

1. Plan and lay out metal framing correctly to ensure that all wall sections are plumbing and properly aligned.

2. Install J-Track along the ceiling line and vertical edges of partitions, positioning the long legs closest to the shaft. Secure each piece with the appropriate low driven fasteners spaced a maximum 24” (600 mm) o.c.

3. Attach J-Track to the floor with fasteners spaced at 24” (600 mm) o.c.

4. Install GlasRoc® Shaftliner gypsum boards vertically with the logo side facing weather exposure during construction. The leading edge of the first panel must be attached to the long leg of the vertical J-Track with 1-5/8” (41 mm) Type S screws spaced 24” (600 mm) o.c. or by using the tabs in the J-Track. Secure the top and bottom edges using the same fasteners and spacing, filling the stud cavity with CertainTeed fiberglass, or equivalent, or mineral fiber insulation.

5. Friction fit an I, C-H or C-T Stud into the top and bottom tracks and slide it snugly against the GlasRoc® Shaftliner gypsum board. Make sure the edge of the board is in full contact with the center web of stud and covered by all of the tabs.

6. Place the next GlasRoc® Shaftliner gypsum board between the tabs and flange on the opposite side of the I, C-H or C-T Stud with no screw attachments required.

7. Install subsequent GlasRoc® Shaftliner gypsum boards and I, C-H or C-T Stud in the same manner with J-Track only for the openings over 9’ (2743 mm).

8. For walls exceeding 12’ (3660 mm) in height, GlasRoc® Shaftliner gypsum board end joints should fall alternately in the upper and lower 1/3 of the partition. Joints may be butted together or use an I, C-H or C-T Stud placed horizontally between boards to secure each joint.

9. Frame all cut openings in the shaft side with J-Track, providing adequate structural support for openings over 4’ (1220 mm).

10. Elevator door frames should be tied to shaftwall enclosures, however, must remain independently supported by the building framing.

Installation of Finished Side

1. Apply a single layer of 5/8” (15.9 mm) ProRoc® Type X with M2Tech® or 1” (25 mm) Type C with M2Tech® gypsum board with 1” (25 mm) Type S screws for one hour rated applications. Apply a second layer with 1-5/8” (41 mm) Type S screws for two hour rated applications, and a third layer with 2-1/4” (57 mm) Type S screws for three hour rated applications. Alternate layers between horizontal and vertical attachment so that outside layer is installed vertically.

2. Holding the gypsum board firmly against the framing, begin fastening in the center of each sheet and move outward to edges and ends.

3. Set fastener heads slightly below the surface without breaking the face paper or damaging the gypsum core.

4. Install sheets in a brick pattern with all ends supported by framing members.

For finishing both sides, apply a single layer of 5/8” (15.9 mm) ProRoc® Type X with M2Tech® or 1” (25 mm) Type S screws. For sound rated partitions follow instructions that include filling the joints with CertainTeed fiberglass or equivalent or mineral fiber insulation and installation of finish side board onto 25 gauge resilient furring channels.
Known for being a leader in interior and exterior building products, CertainTeed provides innovative solutions for commercial, institutional and residential designs. With over 80 years of experience in North America, CertainTeed Gypsum is committed to focusing on quality, service, and safety to provide a superior experience to its customers.

In addition, the company continues to look for ways to reduce impact on the environment while meeting customer demand for sustainable products that deliver comfort, protection and performance.

Benefits of GlasRoc® Shaftliner Type X for Shaftwall Systems

- 12 month limited warranty against exposure
- Resists mold growth per ASTM D 3273 and ASTM G 21
- Economical and efficient installation
- One sided construction of Shaftwalls eliminates the need for extensive scaffolding
- Scores and snaps easily with no special handling required
- Added protection from moisture during construction
- UL Classified and ULC Listed for Fire Resistance
- Rapid ease of installation reduces overall construction time and provides a cost effective system
- Lightweight construction

Through the responsible development of innovative and sustainable building products, CertainTeed has helped shape the building products industry for more than 100 years. Founded in 1904 as General Roofing Manufacturing Company, the firm’s slogan “Quality Made Certain, Satisfaction Guaranteed,” quickly inspired the name CertainTeed. Today, CertainTeed® is North America’s leading brand of exterior and interior building products, including roofing, siding, windows, fence, decking, railing, trim, foundations, pipe, insulation, gypsum, ceilings and access covers.

Characteristics, properties or performance of materials or systems manufactured by CertainTeed herein described are derived from data obtained under controlled test conditions. CertainTeed makes no warranties, express or implied, as to their characteristics, properties or performance under any variations from such conditions in actual construction. CertainTeed assumes no responsibility for the effects of structural movement.
