**Green Glue Noiseproofing Clip layout**

1. Clips are spaced no further than 48 inches apart horizontally
2. Hat channel must not be spaced more than 24 inches vertically
3. Bottom clips must be less than 3 inches from the floor
4. Top clips must be less than 6 inches from the ceiling

*Clips must be placed at the outermost studs on every piece of hat channel*

**Step 1**

Measure for placement of Green Glue Noiseproofing Clips using layout guidelines listed above. Mark locations and install clips using appropriate screws.

**Recommended screws by stud type**

- **Wood:** Use #8 x 2-1/2” coarse thread screws
- **Steel:** Use #8, 10 or 12 x 1-5/8” Type S self-tapping screws
- **Concrete:** Use 3/16” dia x 2-1/4” Tapcon or equal anchor Screw

Outermost clips must be spaced at every interval.

*Install ceiling drywall before walls to allow for a fire stop by butting ceiling drywall to studs*
Step 2

Snap appropriate hat channel into clips

**Recommended hat channel**

- **Size:** 25 gauge hemmed edges
- **Depth:** 7/8”
- **Width Top:** 1 ¼”
- **Width Bottom:** 2 ½”

Most walls will require you to overlap hat channel, instructions for doing so are as follows. Overlap 6 inches of hat channel between two clips. Secure the hat channel with two 7/16” framing screws. 18 gauge tie-wire can also be used.

Step 3

Place shims on the floor to allow spacing between the drywall and the flooring. This ensures decoupling from the floor to make it impossible for vibrations to travel from wall to floor and vice-verse.

Screw drywall in place through hat channel. Be sure drywall is fully installed before removing shims from underneath.

Step 4

Be sure to use an acoustical sealant to fill gaps around electrical boxes, windows, doors, and areas below or above sheets of drywall. Green Glue Noiseproofing Sealant is perfect for this application as it allows flexibility while stopping sound from transmitting through unsealed areas.
